  ▼<div id="right" class="right msg_answer_desc" style="display: block;"> == $0
    " Suicidal ideation must always be prioritized in the assessment phase of counseling
    as results may lead towards higher levels of care needed. The C-SSRS (Columbia-
    Suicide Severity Rating Scale) is the best evidence-supported tool to assess the
    client's needs most quickly and thoroughly. Once a client is cleared for continuing
    the session safely, especially while in a telehealth session, other areas like panic
    can then be addressed. If the client is rated high risk for suicidality, the content
    of the session might then shift towards making referrals either for in-person care or
    possibly inpatient psychiatric services. The HDRS (Hamilton Rating Scale for
    Depression), PDSS (Panic Disorder Severity Scale), and the BAI (Beck Anxiety
    Inventory) are all helpful tools that can be utilized in the assessment phase or as
    part of an ongoing treatment plan goal to further identify and define areas of need;
    they are however not considered the best options for crises interventions or
    specifically ruling out suicidality as the C-SSRS measures and informs history and
    present indicators of ideations, plans, intent and actual suicidal attempts. "
